## ALIGNMENTS

RESULT 1

AMY30582-Y30700 represent apo-B100 derived peptides showing proteoglycan receptor mutations. They were created to identify compounds which modulate atherosclerosis. The peptides are derived from amino acids 3358 to 3367 of apoB100. The method comprises detecting compounds which affect low density lipoprotein (LDL) binding with proteoglycan (PG). The method can be used for identifying compounds which disrupt LDL-PG binding without inhibiting LDL receptor binding. Such compounds can be used to reduce or prevent the formation of atherosclerotic lesions and prevent atherosclerosis. The transgenic non-human animals and mammals which express human apo-B100 can be used as an in vivo model system for the study of atherosclerosis, and in vivo assay methods for identifying compounds which modulate atherosclerosis and/or LDL-PG binding. They can Identifying compounds which affect binding of low density lipoprotein with proteoglycan, used for, e.g. obtaining compounds for reducing atherosclerosis. Apo-B100; proteoglycan receptor mutation; atherosclerosis; low density lipoprotein; proteoglycan; LDL; atherosclerotic lesion. Apo-B100 derived peptide showing a proteoglycan receptor mutation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAY30582-Y30700 represent apo-B100 derived peptides showing proteoglycan receptor mutations. They were created to identify compounds which modulate atheroseleroselerosis. The peptides are derived from antino acids 3358 to 3367 of apo8100. The method compounds are detecting compounds which affect low density lipoprotein (LDL) binding with proteoglycan (PG). The method compounds which distruct LDL-RG binding without inhibiting LDL receptor binding Such compounds can be used to reduce or prevent the formation of atherosclerotic lesions and prevent express human apo-B100 can be used as an in vivo model system for the study of atherosclerosis, and in vivo assay methods for identifying compounds which modulate atherosclerosis and/or LDL-PG binding. They can also be used to identify compounds which result in an increase in atherosclerotic regions. Thus the assays may be used to determine whether also be used to dentify compounds which result in an increase in atherosclerotic regions. Thus the assays may be used to determine whether formation of atherosclerotic lesions. The polymucleotides can also be used in gene therapy for preventing or reducing the severity of atherosclerosis in an animal or mammal
                                                                                                                                                  ô
also be used to identify compounds which result in an increase in atherosclerotic regions. Thus the assays may be used to determine whether a particular food or drug composition tends to stimulate or inhibit the formation of atherosclerotic lesions. The polynucleotides can also be used in gene therapy for preventing or reducing the severity of atherosclerosis in an animal or mammal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying compounds which affect binding of low density lipoprotein with proteoglycan, used for, e.g. obtaining compounds for reducing atherosclerosis.
                                                                                                                                                   Gabs

AAY30582-Y30700 represent apo-B100 derived peptides showing proteoglycan receptor mutations. They were created to identify compounds which modulate atherosclerosis. The peptides are derived from amino acids 3358 to 3367 of apoB100. The method comprises detecting compounds which affect low density lipoprotein (LDL) binding with proteoglycan (PG). The method can be used for identifying compounds which disrupt LDL-FG binding without inhibiting LDL receptor binding. Such compounds can be used to reduce or prevent the formation of atherosclerotic lesions and prevent express human apo-B100 can be used as an in vivo model system for the study of atherosclerosis, and in vivo assay methods for identifying compounds which modulate atherosclerosis and/or LDL-PG binding. They can also be used to identify compounds which result in an increase in atherosclerotic regions. Thus the assays may be used to determine whether a particular food or drug composition tends to stimulate or inhibit the formation of atherosclerotic lesions. The polynucleotides can also be used in gene therapy for preventing or reducing the severity of atherosclerosis in an animal or mammal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New human protein modification and maintenance molecules (PMMM), useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant PMMM expression e.g. cancer, AIDS, epilepsy, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ACC5959 to ACC59889 encode the human protein modification and maintenance molecule proteins given in ABR43240 to ABR43270, designated professed in the phink-11 (1) have cytostatic, antiatrenioselerotic, antiallergic, antinflammatory and thyromimetic activities, anti-HIV, antiallergic, antinflammatory and thyromimetic activities, and can be used in gene therapy. The Phink polypeptides and polymucleotides are useful in diagnosing, treating and preventing diseases or conditions associated with the decreased expression or overaxpression of Phink, such as cell proliferative (e.g. cancer, atherosclerosis), neurological (e.g. epilepsy, Huntington's disease, stroke), immune/inflammatory (e.g. AlDS, allergies) and developmental (e.g. hypothyroidism, Cushing's syndrome) disorders, or infections. They are also useful in assessing the effects of exogenous compounds on the expression of nucleic acid and amino acid
                                                                                                                                                                                                                                                                                        Human; protein modification and maintenance molecule; PMMM; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Elliott VS;

The present invention relates to a new polypeptide (NOVX). The NOVX polypeptide, nucleic acid and antibody are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The NOVX nucleic acids, polypeptides and antibodies are useful for treating, preventing or dispossing diseases such as cancers, Hodgkin disease, Von Hippel-Lindau syndrome, Alzheimer's disease, stroke, tuberous sclerosis, thippel-Lindau palsy, pollepsy, Lesch-Nyhan syndrome, multiple sclerosis, ataxia-telangisctasia, leukodystrophies, addiction, anxiety, depression, pain, obesity, Crohn's disease, osteoporosis, inflammatory bowel disease, infertility, inflammatory bowel disease, atherosclerosis, hypertension, colerosis, hammodeficiencies, HVV, viral, bacterial or parasitic infections, or graft-versus-host disease. The nucleic acids and colerosis asthma, arthritis, immunodeficiencies, HVV, viral, bacterial or parasitic colerosis, properties may also be used as targets for the identification of small
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                    New NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. diabetes, multiple sclerosis, atherosclerosis, cancer, infections, osteoporosis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  molecules that modulate or inhibit e.g. neurogenesis, cell defferentiation, cell proliferation, haematopolesis, wound healing and anglogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to NoVX substances for use in therapeutic or infagnostic methods. The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The present amino acid sequence represents a human NOVX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gарв

The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide sequences in the specification, or their complements or iragments, and sequences in the specification, or their complements or iragments, and sequences in the specification. The probe is a single exon probe that the fully defined in the specification. The probe is a single exon probe that children under this stringency conditions to a nucleic acid molecule expressed in human cells or tissues. Also included are a spatially-captured acid comprising a plurality of single exon nucleic acid molecule expressed in human cells or tissues. Also included are a spatially-captured acide above, where each of the plurality of purbles is separately and addressably isolatable or amplifiable from the plurality, a single exon microarray for measuring human gene expression, a wetor comprising the single exon contiguous amino acide of any of the above-mentioned amino acid exon probe cited above, and acided peptide comprising at least 8 contiguous amino acide of any of the above-mentioned amino acid sequences (optionally with conservative amino acid substitutions), an extended of selling and/or licensing single exon probes or microarray to a customer destring to measure gene expression, and a computer readable exon probes or microarray in solated antibody that binds specifically to a peptide cited above, as customer destring to measure gene expression and acid substitutions) and a customer destring to expression and acid substitutions of a customer destring to a customer destring and a database having a plurality of records to record including data on the expression of a single exon probe according to actor and analysis. The probes may be used as tools for surveying crossesion analysis. The probes may be used as tools for surveying crossesion analysis. The probes may be used as tools for surveying alternative splicing events, in detecting and characterising alternative splicing events, in detectin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The invention relates to a novel isolated polypeptide which is a human kinase and phosphatase (KPP). The polypeptide of the invention demostrates cardiovascular, antiarteriosclerotic, hypotensiave, vasotropic, antianginal, anti-HIV, antiallergic, antiathergic, antianginal, anti-HIV, antiallergic, antiatherior, nephrotropic, antigout, gastrointestinal, neuroprotective, osteopathic, antiarthritic, uropathic, ophthalmological, antitheumatic, antiparkinsonian, nootropic, antilipaemic, antiparastic, antihelmunic, antibacterial, virucide, protozoacide and funglicide activities. The kinase and phosphatase (KPP) polyuncleotides, polypeptides, agonists and antipacterial, virucide, protozoacide suppersonists and phosphatase (KPP) polyuncleotides, polypeptides, agonists and antagonists may be useful for diagnosing, treating or preventing antagonists may be useful for diagnosing, treating or preventing clasorders and viral, bacterial, fungal, parasitic, proliferative disorders and viral, bacterial, fungal, parasitic, proliferative disorders and viral, bacterial, fungal, parasitic, invention may be useful for creating transgenic animals to model human disease and during gene therapy. The current sequence is that of a human KPP protein of the invention.
human; kinase; phosphatase; KPP; cardiovascular; antiarteriosclerotic; hypotensive; vasotropic; antinflammatory; antianginal; anti-HIV; dermialergic; antiasthmatic; immunosuppressive; antitasthmatic; immunosuppressive; antitasthmatic; immunosuppressive; antitathroid; dermatcological; antidabetic; nephrotropic; antigout; gastrointestinal; neuroprotective; osteopathic; antiarthritic; uropathic; ophthalmological; antithermatic; antipartisnosian; nootropic; antiparamit; hemostatic; crtostatic; antilpaemic; antiparasitic; antibacterial; virucide; protozoacide; fungicide; cardiovascular disease; immune system; neurological; growth; development; cell proliferation; viral; bacterial; fungal; parasitic; protozoan; single nucleotide polymorphism; SNP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Tran UK;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New human kinases and phosphatases, useful for diagnosing, treating or preventing atherosclerosis, hypertension, AIDS, allergy, multiple sclerosis, osteoarthritis, Alzheimer's disease, Crohn's disease, cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Richardson TW, Marquis JP, Swarnakar A, Tang YT;

This invention relates to a novel method of treating a human subject having a tumourigenic disorder or angiogenic disorder, caused by aberrant gene expression or activity of an isolated protein, by administering a modulator. The modulator may have cytostatic, antithyroid, antidiabetic or ophthalmological activity. The method is useful for treating a subject having a tumourigenic or angiogenic disorder, in particular for treating cancer (for example breast cancer, colon cancer, lung cancer or prostatic cancer) and, for example, Grave's disease and diabetic retinopathy. The present sequence is the amino acid sequence of the novel isolated human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Treating subject having tumorigenic disorder or angiogenic disorder caused by aberrant polypeptide e.g., N-formylpeptide receptor or nucleic acid, by administering a modulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   bronchial asthma; chronic obstructive pulmonary disease;

AAY30582-Y30700 represent apo-B100 derived peptides showing proteoglycan receptor mutations. They were created to identify compounds which modulate atherosclerosis. The peptides are derived from amino acids 3358 to 3367 of apoB100. The method comprises detecting compounds which affect low density lipoprotein (LDE) binding with proteoglycan (PG). The method can be used for identifying compounds which disrupt LDL-PG binding without inhibiting LDL receptor binding. Such compounds can be used to reduce or prevent the formation of atherosclerotic lesions and prevent atherosclerosis. The transgenic non-human animals and mammals which express human apo-B100 can be used as an in vivo model system for the study of atherosclerosis, and in vivo assay methods for identifying compounds which medulate atherosclerosis and/or LDL-PG binding. They can also be used to identify compounds which result in an increase in atherosclerotic regions. Thus the assays may be used to determine whether
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   a particular food or drug composition tends to stimulate or inhibit the formation of atherosclerotic lesions. The polynucleotides can also be used in gene therapy for preventing or reducing the severity of atherosclerosis in a animal or mammal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying compounds which affect binding of low density lipoprotein with proteoglycan, used for, e.g. obtaining compounds for reducing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present introductive pulmonary disease. The method comprises
determining the expression level of a marker gene in a biological sample
from a subject, comparing the expression level determined with the
expression level of the marker gene in a biological sample from a healthy
ce expression level of the marker gene comprises: (a) a group of
subject, and judging whether the subject has bronchial asthma or chronic
obstructive pulmonary disease. The marker gene comprises: (a) a group of
genes (S1) whose expression levels increase when respiratory epithelial
cells are stimulated with interleukin-13; or (b) a group of genes (S2)
whose expression levels decrease when respiratory epithelial
cells are stimulated with interleukin-13. Also described: (l) a reagent (l) for
testing for bronchial asthma or chronic obstructive pulmonary disease;
co treat bronchial asthma or chronic obstructive pulmonary
cc to treat bronchial asthma or chronic obstructive pulmonary
cc an animal model for bronchial asthma or chronic obstructive pulmonary
cc disease; (4) an inducer that induces bronchial asthma in a mouse; (5) a
cuthod for producing an animal model for bronchial asthma in chronic
cobstructive pulmonary disease; (6) a therapeutic agent for bronchial
cc asthma or chronic obstructive pulmonary disease, comprising for
cc amarker gene or an antisense nucleic acid corresponding to a portion of
ct marker gene or an antisense nucleic acid corresponding to a portion of
cc aprocesion of the gene through an RNAi effect or an antibody recognising
cc aprocesion of the gene through an RNAi effect or an antibody accomising
cc aprocesion of the marker gene, and (7) a by an arker gene, and than asthma or a chronic obstructive pulmonary disease, on which a
cprobe has been immobilised to assay a marker gene. (I) has respiratory
cc and antiasthmatic activities, and can be used in gene therapy. The method
is useful for testing for or screening event invention.
cc bronchial asthma or chronic obstructive pulmonary disease. The present
cc sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Testing for bronchial asthma or chronic obstructive pulmonary disease by comparing the expression level of a marker gene in a biological sample from a subject with the expression level of the gene in a sample from a healthy subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a method of testing for bronchial asthma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

AAY30582-Y30700 represent apo-B100 derived peptides showing proteoglycan receptor mutations. They were created to identify compounds which commutations. They were created to identify compounds which commutations acids 3358 to modifiate atheroselzerois. The peptides are derived from amino acids 3358 to 3357 of apoB100. The method comprises detecting compounds which affect can be used for identifying compounds which disrupt LDL-FG binding without inhibiting LDL receptor binding. Such compounds can be used to reduce or prevent the formation of atheroselerotic lesions and prevent atheroselerosis. The transgenic non-human animals and mammals which express human apo-B100 can be used as an in vivo model system for the express human apo-B100 can be used as an in vivo model system for the express human apo-B100 can be used as an in vivo model system for the compounds which medulate atheroselerosis and/or LDL-FG binding. They can also be used to identify compounds which result in an increase in atheroselerotic regions. Thus the assays may be used to determine whether formation of atheroselerotic lesions. The polynucleotides can also be used in gene therapy for preventing or reducing the severity of atheroselerosis in an animal or mammal
                                                                                                                                                                                                                                                                                                                                                                                              Claim 17; Page 57; 70pp; English.

AAY30582-Y30700 represent apo-B100 derived peptides showing proteoglycan receptor mutations. They were created to identify compounds which arceptor mutations. They were created to identify compounds which acceptor mutations. They were created to identify compounds which acceptor acceptor and a size of a manner acceptor and a size of a manner acceptor and a size of a manner acceptor and a size of a manner acceptor and a size of a manner acceptor and a size of a manner acceptor and a size of a manner acceptor and a size of a manner acceptor and a size of a manner acceptor and a size of a manner acceptor acceptor and a size of a manner acceptor and a size of a manner acceptor attention of a therosclerosis. The transgenic non-human animals and mammals which attention and an animal and an invivo model system for the acceptor and an acceptor and an invivo model system for the acceptor also be used to identify compounds which result in an increase in also be used to identify compounds which result in an increase in a prevent regions. Thus the assays may be used to determine whether a particular food or drug composition tends to stimulate or inhibit the formation of atherosclerotic lesions. The polymucleotides can also be acceptor and a particular food or drug composition are acceptor and a particular food or drug composition are acceptor and a particular food or drug composition acceptor acceptor and a particular food or drug composition acceptor acceptor and a particular food or drug composition acceptor acceptor and a particular food or drug composition acceptor acceptor and a particular food or drug composition acceptor acceptor and a particular food or drug composition acceptor acceptor and a particular food or drug composition acceptor acceptor and a particular food acceptor acceptor acceptor acceptor acceptor acceptor acceptor acceptor acceptor acceptor acceptor acceptor acceptor acceptor acceptor acceptor acceptor acceptor acceptor acceptor acceptor acceptor acceptor acceptor acceptor acceptor acceptor acceptor
                                                                                    tifying compounds which affect binding of low density lipoprotein proteoglycan, used for, e.g. obtaining compounds for reducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying compounds which affect binding of low density lipoprotein with proteoglycan, used for, e.g. obtaining compounds for reducing

AAY30582-Y30700 represent apo-B100 derived peptides showing proteoglycan receptor mutations. They were created to identify compounds which conditions activated from amino acids 3358 conditions activated from amino acids 3358 to 3367 of apoB100. The method comportses detecting compounds which affect low density lipoprotein (LDL) binding with proteoglycan (FG). The method compounds unit proteoglycan (FG). The method can be used for identifying compounds which disrupt LDL-FG binding withbut inhibiting LDL receptor binding. Such compounds can be used to requere or prevent the formation of atherosclerotic lesions and prevent catherosclerosis. The transgenic non-human animals and mammals which express human apo-B100 can be used as an in vivo model system for the compounds which modulate atherosclerosis and/or LDL-FG binding. They can also be used to identify compounds which result in an increase in atherosclerotic regions. Thus the assays may be used to determine whether a particular food or drug composition tends to stimulate or inhibit the formation of atherosclerotic lesions. The polynucleotides can also be used in gene therapy for preventing or reducing the severity of atherosclerosis in an animal or mammal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                   Res. 77:31-38(2000).

FINCTION: Responsible for the amidation of carboxylic groups at FUNCTION: Responsible for the amidation of carboxylic groups at Dostiton A and C of either cobyrinic acid or hydrogenobrynic acid. NH(2) groups are provided by glutamine, and one molecule of ATP is hydrogenolyzed for each amidation (By similarity).

FATHWAY: Cobalamin biosynthesis.

SIMILARITY: Belongs to the cobB/cobQ family. CobB subfamily.

Identifying compounds which affect binding of low density lipoprotein with proteoglycan, used for, e.g. obtaining compounds for reducing atherosclerosis.

AAY30582-Y30700 represent apo-B100 derived peptides showing proteoglycan receptor mutations. They were created to identify compounds which modulate atherosclerosis. The peptides are derived from amino acids 3358 to 3367 of apo8100. The method comprises detecting compounds which affect low density lipoprotein (LDL) binding with proteoglycan (PG). The method comprises detecting compounds which affect without inhibiting LDL receptor binding. Such compounds can be used to reduce or prevent the formation of atherosclerotic lesions and prevent atherosclerosis. The transgenic non-human animals and mammals which activity of atherosclerosis, and in vivo model system for the study of atherosclerosis, and in vivo assay methods for identifying compounds which modulate atherosclerosis and/or LDL-PG binding. They can

```
also be used to identify compounds which result in an increase in atherosclerotic regions. Thus the assays may be used to determine whether a particular food or drug composition tends to stimulate or inhibit the formation of atherosclerotic lesions. The polynucleotides can also be used in gene therapy for preventing or reducing the severity of atherosclerosis in an animal or mammal

AAY30582-Y30700 represent apo-B100 derived peptides showing proteoglycan receptor mutations. They were created to identify compounds which method computed at the peptides are derived from amino acids 3358 to 3367 of apoB100. The method comprises detecting compounds which affect low density lipoprotein (LDL) binding with proteoglycan (PG). The method can be used for identifying compounds which disrupt LDL-PG binding without inhibiting LDL receptor binding. Such compounds can be used to atherosclerosis. The transgenic non-human animals and mammals which express human apo-B100 can be used as an in vivo model system for the compounds which modulate atherosclerosis and/or LDL-PG binding. They can be used to identify compounds which result in an increase in a particular food or drug composition tends to etimulate or inhibit the formation of atherosclerosic aparticular food or drug composition tends to etimulate or inhibit the commation of atherosclerosic lesions. The polynucleotides can also be used in gene therapy for preventing or reducing the severity of atherosclerosis in an animal or mammal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

AAY30582-Y30700 represent apo-Blo0 derived peptides showing proteoglycan receptor mutations. They were created to identify compounds which receptor mutations. They were created to identify compounds which which are method comprises detecting compounds which affect to 3367 of apoBlo0. The method comprises detecting compounds which affect can be used for identifying compounds which fisciple. FG binding without inhibiting IDL receptor binding. Such compounds can be used to atherosclerosis. The transgenic non-human animals and mammals which express human apo-Blo0 can be used as an in vivo model system for the express human apo-Blo0 can be used as an in vivo model system for the express human apo-Blo0 can be used as an in vivo model system for the compounds which medulate atherosclerosis and/or LDL-PG binding. They can also be used to identify compounds which result in an increase in a particular food or drug composition tends to stimulate or inhibit the used in gene therapy for preventing or reducing the severity of atherosclerosis in an animal or mammal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New human protein modification and maintenance molecules (PMMM), useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant PMMM expression e.g. cancer, AIDS, epilepsy, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ACC5959 to ACC59889 encode the human protein modification and maintenance molecule proteins given in ABR43240 to ABR43270, designated Professor antianteriosclerotic, antianteonormulant, nootropic, neuroprotective, carebroprotective, anti-HIV, antiallergic, antinflammatory and thyromimetic activities, and can be used in gene therapy. The PWMM polypeptides and polymucleotides are useful in diagnosing, treating and preventing diseases or conditions associated with the decreased expression or overexpression of PWMM, such as cell proliferative (e.g. cancer, atherosclerosis), neurological (e.g. epilepsy, Huntingron's disease, stroke), immune/inflammatory (e.g. allergies) and developmental (e.g. hypothyroidism, Cushing's syndrome) disorders, or infections. They are also useful in assessing the effects of exogenous compounds on the expression of nucleic acid and amino acid
                                                                                                                                                                                                                                      Human; protein modification and maintenance molecule; PMMM; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Hafalia AJA,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Elliott VS;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .8-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        -NDD-91
     The present invention relates to a new polypeptide (NOVX). The NOVX colypeptide, nucleic acid and antibody are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, confederably a NOVX-associated disorder. The NOVX nucleic acids, or preferably a NOVX-associated disorder. The NOVX nucleic acids, or dispeptides and antibodies are useful for treating, preventing or dispensing diseases such as cancers, Hodgkin disease, Von Hippel-Lindau Syndrome, Alzheimer's disease, stroke, tuberous sclerosis, hypercalcaemia, Parkinson's disease, Huntington's disease, cerebral hypercalcaemia, Parkinson's disease, Huntington's disease, cerebral palay, epilepsy, Lesch-Nyhan syndrome, multiple sclerosis, ataxiactelsopaly, coherentality, inflammatory bowel disease, atherosclerosis, hypertension, obesity, Crohn's disease, osteoporosis, inflammatory bowel disease, atherosclerosis, hypertension, scleroforma, hemophilia, diabetes, pancreatitis, autoimmune disease, infections, or graft-versus-host disease. The nucleic acids and scleroforman, any also be used as targets for the identification of small complements, in gene thorapy, in generation of antibodies that bind differentiation, cell proliferation, hematopoiesis, wound healing and cimmunospecifically to NOVX substances for use in therapeutic or anglogenesis, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The present amino acid sequence represents a human NOVX notes in the invanrion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                       New NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. diabetes, multiple sclerosis, atherosclerosis, cancer, infections, osteoporosis or Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence; corn.

Claim 8; SEQ ID NO 6; 145pp; English.

```
This invention relates to a novel method for targeting disruption of an arbitrary gene in a genome of an organism which comprises providing the whole sequential data of the genome of such organism, selecting at least a sequence, providing a vector that contains a transformation, and homologous recombination. The genome is preferably the genome of a hyperthermostable archaebacterium, particularly contains a discussion of a game in the genome of an organism, which is applicable in the genome of a pane in the genome of an organism, which is applicable in cutython of a game in the genome of an organism, which is applicable in the genome of an organism, which is applicable in cutying gene structure and functions as well as enzyme activities of inspection, molecular biology and immunology, with this method, the disruption of a gene at an arbitrary position in a genome can be achieved disruption of a gene at an arbitrary position in a genome can be achieved the genome of Thermococcus kodakaraensis which was derived using the method of the invention. Note: The sequence data for this per mined electronic format directly from NIPO at the invention of the printed specification, but was obtained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the contained the
                                             Method for disrupting targeted gene in genome of organism particularly thermostable bacterium and with genome chips for analysis, applicable in studying gene structure and functions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Xanthomonas axonopodis pv citri plant pathology-related XAC3136 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Xanthomonas microorganism; plant; pathology; bacterial pest; Xac; Xcc;

New nucleic acid molecule from a Xanthomonas microorganism, useful in determining the presence of Xanthomonas bacteria in a sample.

Ferro JA;

```
The invention relates to a novel isolated nucleic acid molecule from a Manthomonas microorganism where the nucleic acid molecule is associated with pathogenicity caused by the Xanthomonas microorganism, or its variant, that causes reduced or enhanced pathogenicity. The nucleic acid che invention may be useful in detecting the presence of Xanthomonas bacteria in a sample, as well as in plant pathology, for example, for acaded by bacterial pests. The current sequence is that of the Xanthomonas axonopodis pv. citri (Xac) plant pathology related XAC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               the 611 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                      Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Zyskind JW;

proliferation, of the activity of a gale in an operon required to proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibite cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or agene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, s activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the to which each of the strains is present in a cultier acids required for organism. The antisense nucleic acids required for cellular proliferation to isolate candidate molecules for rational datiscovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence date for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the present sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human neurofibromatosis type 1 (NP1)-GAP related domain (GRD) mutant clones NP201 (Given in AAR59221) and NP204 (AAR59922) show strong suppression activity for RAS7Valls, and inhibit v-Ras-induced transformation in mammalian cells. The mutation sites of these proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ras; GTPase activating protein; GAP; GAP related domain; GRD; RAS2; v-Ras; heat shock; neurofibromatosis type 1; NF1.
proliferation or the activity of a gene in an operon required for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Blocking Ras-induced effects on a cell - by introducing a GTPase activating protein to the cell, used esp. in treatment of cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        77.3%; Score 34; DB 6; Length 840; 87.5%; Pred. AAY30582-Y30700 represent apo-B100 derived peptides showing proteoglycan receptor mutations. They were created to identify compounds which modulate atherosclerosis. The peptides are derived from amino acids 3358 to 3367 of apoB100. The method comprises detecting compounds which affect low density lipoprotein (LDL) binding with proteoglycan (PG). The method compounds which disrupt LDL-PG binding withbut inhibiting LDL receptor binding. Such compounds can be used to reduce or prevent the formation of atherosclerotic lesions and prevent express human apo-B100 can be used as an in vivo model system for the study of atherosclerosis, and in vivo assay methods for identifying compounds which modulate atherosclerosis and/or LDL-PG binding. They can also be used to identify compounds which result in an increase in atherosclerotic regions. Thus the assays may be used to determine whether a particular food or drug compounds which result in an increase in atherosclerotic regions. Thus the assays may be used to determine whether formation of atherosclerotic lesions. The polynucleotides can also be used in gene therapy for preventing or reducing the severity of atherosclerosis in an animal or mammal
                                                                                                                                                                                         ö
were located in one of the most conserved regions of GRD. These sites were compared with those of other GRD family proteins, yeast Ira2 (AAR59926) and Ira1 (AAR59931), human GAP (AAR5994) and Schizosaccharomyces pombe Gap1 (AAR59925). (Updated on 25-MAR-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying compounds which affect binding of low density lipoprotein with proteoglycan, used for, e.g. obtaining compounds for reducing atherosclerosis.
                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAY30582-Y30700 represent apo-B100 derived peptides showing proteoglycan receptor mutations. They were created to identify compounds which computate atherosals. They were created to identify compounds which computate atherosals. The peptides are derived from amino acids 3388 to 3367 of apoB100. The method comprises detecting compounds which affect can be used for identifying compounds which disrupt LDL-PG binding with proteoglycan (PG). The method compounds to the transpend or atherosal-croats. The transpend on human animals and mammals which express human apo-B100 can be used an in vivo model system for the express human apo-B100 can be used an in vivo model system for the express human apo-B100 can be used an in vivo model system for the express human apo-B100 can be used and in vivo assay methods for identifying also be used to identify compounds which result in an increase in the appartantal food or drug composition tends to stimulate or inhibit the formation of atherosales. Thus the assays may be used to determine whether formation of atherosales in an animal or reducing the severity of atherosales in an animal or mammal

```
The present sequence represents a specifically claimed Apo B binding site peptide which can be used as a component of a non-naturally occurring, receptor-competent low density lipoprotein (LDL) particle of the present invention. The LDL particle comprises at least 1 peptide component that Las at least 1 binding site for an apo B protein receptor and at least 1 invention. The LDL particle of secribed in the invention are peptides containing an apo B binding sequence with at least 70% identity with sequences: KAEYKKNKHRH (1) or TTRLTRKRGLK (2), or their dimers. Non-sequences: KAEYKKNKHRH (1) or TTRLTRKRGLK (2), or their dimers. Non-articles are useful as: (1) drug-targeting vectors for delivering anticancer drugs to cancer cells that express an apo B protein receptor, and (ii) additives for call culture media especially as growth supplements. Non-naturally occurring, ceceptor-competent LDL particles do not require the complete apo B sequence, which is large and tends to aggregate, to provide binding affinity to an apo B protein receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ï

prothrombinase complex.

Synthetic. Homo sapiens WO9743311-A1

```
The present sequence represents a specifically claimed Apo B 100 binding site peptide analogue which can be used as a component of a non-naturally occurring, receptor-competent low density lipoprotein (DDL) particle of the present invention. The LDL particle comprises at least 1 peptide component that has at least 1 binding site for an apo B protein receptor and at least 1 lipophilic substituent. Also described in the invention are peptides containing an apo B binding sequence with at least 10% identity with sequences: KAEYKKNKHRH (1) or TTRLTRKRGLK (2), or their dimers. Non-naturally occurring, receptor-competent LDL particles are useful as: (i) drug-targeting vectors for delivering anticancer drugs to cancer cells that express an apo B protein receptor, and (ii) additives for cell culture media especially as growth supplements. Non-naturally occurring, receptor-competent LDL particles do not require the complete app B sequence, which is large and tends to aggregate, to provide binding
                                                                                            Apo B; binding site; receptor; cancer; drug delivery; anticancer; growth supplement; non-natural lipid particle; low density lipoprotein; LDL; receptor component; apo B100 receptor site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Non-natural lipid particle comprising peptide binding to apo B protein receptor - useful as, e.g. vector for delivering drugs to cancer cells that express this receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Anti-coagulant, apolipoprotein B-100, apoB-100, metastatic spread, thromboplastin-mediated process, cancer, inhibitor, blood coagulation, anglogenesis, cellular differentiation, apoptosis, KRAD-14;

This sequence is an example of the peptide of the invention. It has the formula (I), or their variants with one or more internal deletions, insertions or substitutions, while retaining anti-coagulant properties of apolipoprotein B-100 (apo8-100). IL-KAQ-XI-KKONKARNE-XZ-T-ZZ (I) X1 = S or Y; X2 = T or I; Z1 = the N terminus of the peptide, or 1-47 amino acids ca); Z2 = the C terminus of the peptide are used for simultaneous, ca ... Compositions containing the peptide are used for simultaneous, ca ... Compositions containing the peptide are used for simultaneous, compositions containing the peptide are used for simultaneous, compositions containing the peptide are used for simultaneous, compositions or sequential treatment of cancer, particularly to prevent or reduce blood coagulation (e.g. processes, specifically to prevent or reduce blood coagulation (e.g. during or after surgery or in cases of heart attack, stroke etc.) and to inhibit angiogenesis, callular differentiation or apoptosis. KRAD-14, which is active as such or as part of a 98-aa peptide, inhibits active as such or as part of a 98-aa peptide, inhibits active and the surface of thromboplastin and of platelets by thrombin. It blinds to the residues 58-66 of thromboplastin. Since (I) are much
                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptide fragments of apo:lipo:protein B-100 with anticoagulant activity used for treating or preventing coagulation, inhibiting angiogenesis, cell differentiation and apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Disclosure; Page 22; 60pp; English.
